

## What's new in SafeGuard 5.6

Get our best performance and protection yet. And, we've made it easier to protect your data and comply with regulations.

Key new features:

### Performance

#### Opal drive support

- We automatically use Opal self-encrypting drives when available and software encryption when they're not. And, you can manage encryption across all your computers and platforms from our central management console.

#### Accelerated encryption

- We use the multicore processors in your computers to encrypt and decrypt your data quickly. And, our encryption speeds are now up to 30% faster.

#### Faster initial encryption

- We offer a fast initial encryption option that encrypts only the parts of your hard drive in use. This reduces the time needed to encrypt and lets users get to work faster.

#### Improved support for virtual desktops and dynamic drives

- We don't encrypt the entire virtual drive — only the parts of your physical and virtual drives in use.

### Protection

#### Improved manageability

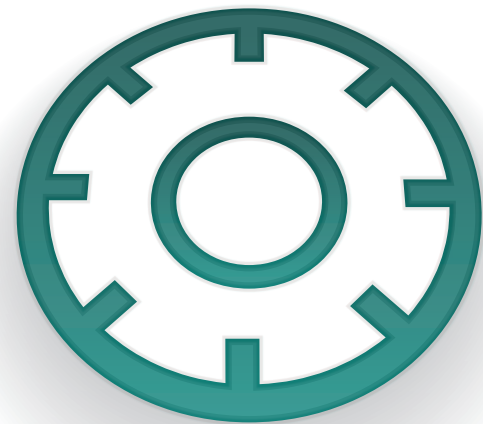

- We've made managing Data Exchange and Configuration Protection even easier—with white listing of removable drives to be encrypted, simplified key retirement, policy merging, temporary policy deactivation and more.

#### Scheduled AD sync

- Now you can schedule common tasks like Active Directory syncs and deleting event logs with just a few clicks in our central management console.

#### Enhanced reporting

- Our simplified at-a-glance compliance report shows you which computer security policies are out of date. This helps keep your data protected and your computers compliant.

### Upgrade today

Have a maintenance contract? Then when we upgrade our product, you get it for free.
