1 About Sophos Central Wireless

To be able to manage your Sophos access points via Sophos Central, you need to have a Sophos Central account with a Wireless license. If you already have a Sophos Central Admin Account, you can start a Wireless trial directly from your Sophos Central Admin account. After that you can decide if you want to purchase a license.

Network requirements

To use any access point with Sophos Wireless, the access point must be able to communicate with Sophos Central. Therefore, the following requirements must be met:

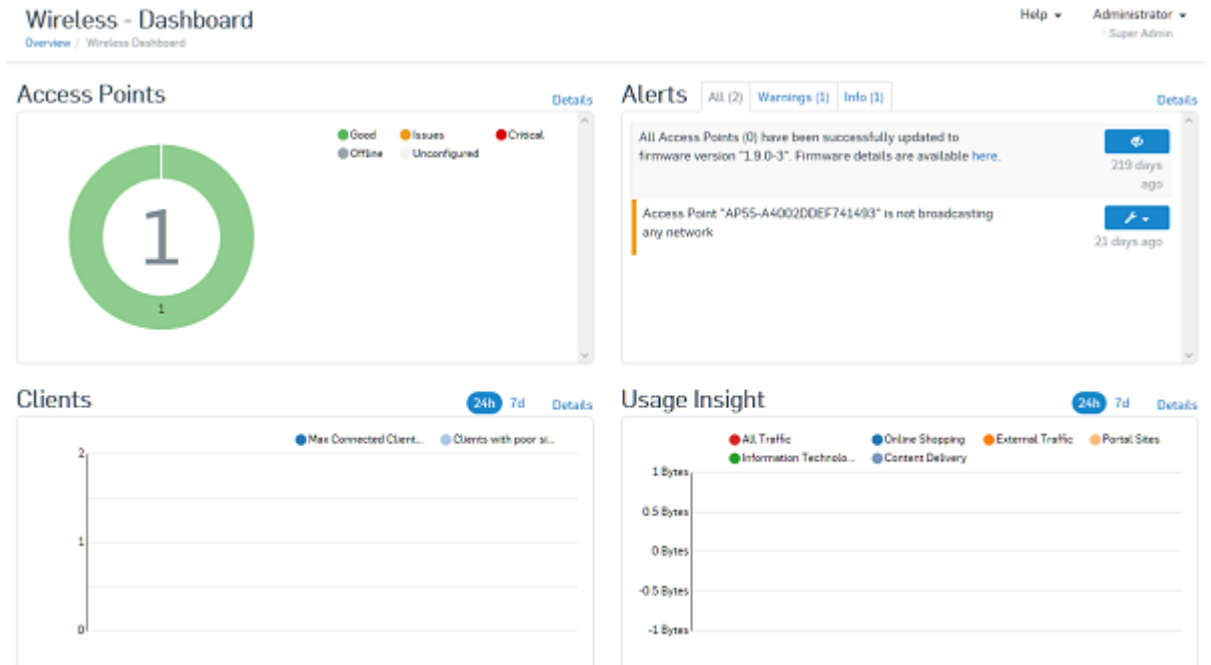

- DHCP and DNS server are configured to provide an IP address to the access point and answer its DNS requests (IPv4 only).
- Access point can reach Sophos Central without requiring any VLAN to be configured on the AP for this connection.
- Communication on ports 443, 123, and 80 to any Internet server is possible.
- No HTTPS proxy on the communication path.

2 Features

Sophos Central Wireless provides strong features to manage and protect Sophos access points. This guide provides information about the general Wireless settings you can make.

3 Dashboard

The dashboard itself provides an overview of important information.

Click on items in the legend to show/hide data that is relevant to you. When the circle of an item is filled, the corresponding information is displayed.

4 Firmware Settings

On **Wireless > Settings** you can look up your current firmware version. Additionally, you can schedule when the system checks for new updates and installs them. We recommend setting a time when no-one is using the networks, as a firmware update causes a network outage of approximately five minutes.
